

33.19 Why is the twistor commutator  $Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha$  real?

$\langle \psi | (Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha) \phi \rangle = \langle (Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha) \psi | \phi \rangle$ , since when you move operators from the right to the left side of an amplitude, you take the complex conjugate and reverse the order of operation. So  $Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha$  is the dual of itself.

So if  $Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha = \beta I$ , where  $\beta$  is a complex number, then  
 $\bar{\beta} \langle \psi | \phi \rangle = \langle \beta \psi | \phi \rangle = \langle (Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha) \psi | \phi \rangle = \langle \psi | (Z^\alpha \bar{Z}_\alpha - \bar{Z}_\alpha Z^\alpha) \phi \rangle = \langle \psi | \beta \phi \rangle = \beta \langle \psi | \phi \rangle$ ,  
so  $\beta$  must be real.

This is only a guess ...
